

$L = 89$, $\alpha = 55/89$, $t_0 = 1$, $\Delta_0 = 0.5$, $V = 2.5$, $W = 0.01$, $A = B = 0.8$, $\theta = 0$, PBC

Static reference: $\max_n |E_n|/t_0 = 3.298404$, $\omega_{\text{fold}}/t_0 = 6.596808$ (vertical dashed line).

The static folding scale is a reference, not a driven-resonance criterion. All markers are computed eigenstates; effective-state colors are bare D_n.
