Quasienergy-selective response and effective-model controls

$L = 89$, $\alpha = 55/89$, $t_0 = 1$, $\Delta_0 = 0.5$, $V = 2.5$, $W = 0.01$, $A = B = 0.8$, $\theta = 0$, PBC

Outer / central sets: largest / smallest 36 values of $|q_n|$ at each point. (b) Actual fixed-bin means; empty bins are gray and counts are exported to CSV.

(c) $H_0 + g_F J_2^x$ versus H_0, with the same kick in both: a truncated-model contrast, not exclusive causal proof for exact Floquet dynamics.

(d) $P_{\text{eff}} = [\sum_m |\langle u_m^{\text{eff, kick}} | \psi_n^{\text{exact}} \rangle|^4]^{-1}$; one means a single basis vector. Dashed vertical line: static folding reference.
